

[API reference](#)[Route prop](#)**Version: 6.x**

Route prop reference

Each `screen` component in your app is provided with the `route` prop automatically. The prop contains various information regarding current route (place in navigation hierarchy component lives).

- `route`
 - `key` - Unique key of the screen. Created automatically or added while navigating to this screen.
 - `name` - Name of the screen. Defined in navigator component hierarchy.
 - `path` - An optional string containing the path that opened the screen, exists when the screen was opened via a deep link.
 - `params` - An optional object containing params which is defined while navigating e.g. `navigate('Twitter', { user: 'Dan Abramov' })`.

```
function ProfileScreen({ route }) {  
  return (  
    <View>  
      <Text>This is the profile screen of the app</Text>  
      <Text>{route.name}</Text>  
    </View>  
  );  
}
```
