

Installation

An overview of how to install and use React Native for Web.

React Native for Web can be used for multi-platform and web-only applications. It can be incrementally adopted by existing React Web apps and integrated with existing React Native apps. Preact is also supported.

```
npm install react-dom react-native-web
```

The Babel plugin is recommended for build-time optimizations.

```
npm install --save-dev babel-plugin-react-native-web
```

Quickstart

Expo

[Expo](#) is a framework and a platform for universal React applications. [Expo for Web](#) uses React Native for Web, provides dozens of additional cross-platform APIs, includes web build optimizations, and is compatible with the broader React Native ecosystem. See the Expo docs for more information.

Create React App

[Create React App](#) is a basic way to setup a simple, web-only React app with built-in support for aliasing `react-native-web` to `react-native`. However, it's generally recommended that you use Expo.

```
npx create-react-app my-app  
cd my-app
```

```
npm install react-native-web  
npm start
```
