

InputAccessoryView

A component which enables customization of the keyboard input accessory view on iOS. The input accessory view is displayed above the keyboard whenever a `TextInput` has focus. This component can be used to create custom toolbars.

To use this component wrap your custom toolbar with the `InputAccessoryView` component, and set a `nativeID`. Then, pass that `nativeID` as the `inputAccessoryViewID` of whatever `TextInput` you desire. A basic example:

InputAccessoryView

```
import React, {useState} from 'react';
import {Button, InputAccessoryView, ScrollView, TextInput}
from 'react-native';

const App = () => {
  const inputAccessoryViewID = 'uniqueID';
  const initialText = '';
  const [text, setText] = useState(initialText);

  return (
    <>
      <ScrollView keyboardDismissMode="interactive">
        <TextInput
          style={{
            padding: 16,
            marginTop: 50,
          }}
          inputAccessoryViewID={inputAccessoryViewID}
          onChangeText={setText}
          value={text}
          placeholder={'Please type here...'}
        />
      </ScrollView>
      <InputAccessoryView nativeID={inputAccessoryViewID}>
        <Button onPress={() => setText(initialText)}
          title="Clear text" />
      </InputAccessoryView>
    </>
  );
}
```

This component can also be used to create sticky text inputs (text inputs which are anchored to the top of the keyboard). To do this, wrap a `TextInput` with the

InputAccessoryView component, and don't set a `nativeID`. For an example, look at [InputAccessoryViewExample.js](#).

Reference

Props

backgroundColor

TYPE
color

nativeID

An ID which is used to associate this `InputAccessoryView` to specified `TextInput(s)`.

TYPE
string

style
