Introduction to Expo Router

Expo Router is an open-source routing library for Universal React Native applications built with Expo.

Expo Router is a file-based router for React Native and web applications. It allows you to manage navigation between screens in your app, allowing users to move seamlessly between different parts of your app's UI, using the same components on multiple platforms (Android, iOS, and web).

It brings the best file-system routing concepts from the web to a universal application — allowing your routing to work across every platform. When a file is added to the **app** directory, the file automatically becomes a route in your navigation.

Features

- **Native:** Built on top of our powerful [React Navigation suite](#), Expo Router navigation is truly native and platform-optimized by default.
- **Shareable:** Every screen in your app is automatically deep linkable. Making any route in your app shareable with links.
- **Offline-first:** Apps are cached and run offline-first, with automatic updates
