

UDS and TypeScript

TypeScript is an extension of the JavaScript language which adds type annotations to support compile-time type-checking and IDE integrations. You can learn more about TypeScript via the [official docs](#).

Because all parts of UDS are distributed as regular npm packages, they can be consumed in TypeScript projects in exactly the same way as in JavaScript projects. No additional setup is required.

Internally, UDS is written in plain JavaScript, and currently does not offer typing files for any of its packages. If you would be interested in exported types for any particular UDS package, you can [raise an issue](#) requesting this (don't forget to search existing issues to see if someone else has the same request—you can upvote an existing issue to let us know that multiple users want this feature).
