

Linking

Linking gives you a general interface for securely opening external URLs from JavaScript.

```
import { Linking } from 'react-native';
```

API

Static methods

canOpenURL: (url) => Promise<boolean>

Returns a **Promise** that resolves to a boolean indicating whether the app can open the URL.

getInitialURL: () => Promise<string>

Returns a **Promise** that resolves to the string of the URL that initially loaded the app.

openURL: (url, target) => Promise<>

Try to open the given url in a secure fashion. The provided target (including **undefined**) will be passed as the window target, or “_blank” if no target included. The method returns a Promise object. If the url opens, the promise is resolved. If not, the promise is rejected.
