# EAS Update

An introduction to EAS Update which is a hosted service for projects using the expo-updates library.

**EAS Update** is a hosted service that serves updates for projects using the `expo-updates` library.

EAS Update makes fixing small bugs and pushing quick fixes a snap in between app store submissions. It accomplishes this by allowing an end-user's app to swap out the non-native parts of their app (for example, JS, styling, and image changes) with a new update that contains bug fixes and other updates.

All apps running the `expo-updates` library have the ability to receive updates. To start using EAS Update, continue to the [Getting Started](#) guide.

Still using Classic Updates? We moved those docs to [the archive](#).

## Pitch

### Improve User Experience

EAS Update allows you to release hotfixes and enhancements in response to user feedback or market trends. It helps you keep users engaged and satisfied with your app
