Introduction

Use `Table` to display tabular data.

- Available in 2 cell spacings (default, compact)
- Available in 2 text styles (medium, small)
- When `Table` exceeds viewport, the first column becomes sticky, enabling horizontal scrolling
- Right-align prices and numbers that display decimal points (`align` prop)

[Follow the appropriate instructions](#) to add this component in to your app.

Guidance

- Use `Table.Header` and `Table.Body` as direct children of `Table`
- Use `Table.SubHeading` to render an intermediate data heading row
- Use `Table.Row` and `Table.Cell` to build up the tabular data
- Use `Cell`'s `type` prop to visually mark it as a row heading (`variant={{ type: "rowHeading" }}`)
- Use `Cell`'s `align` prop to change its content horizontal alignment

Accessibility

The `Table` component uses the native html table syntax, making it accessible for screen readers by design.

If the table's content is wider than the container's width, the table becomes scrollable and the first column becomes sticky.

	Header 1	Header 2	Header 3	Header 4	Header 5	Header 6
Sticky first column	Table data	Table data	Table data	Table data	Table data	Table data

```

<Table spacing="compact" text="small">
