🏠   API reference   Hooks   useTheme

Version: 6.x

useTheme

The `useTheme` hook lets us access the currently active theme. You can use it in your own components to have them respond to changes in the theme.

```
import * as React from 'react';
import { TouchableOpacity, Text } from 'react-native';
import { useTheme } from '@react-navigation/native';

// Black background and white text in light theme, inverted on dark theme
function MyButton() {
  const { colors } = useTheme();

  return (
    <TouchableOpacity style={{ backgroundColor: colors.card }}>
      <Text style={{ color: colors.text }}>Button!</Text>
    </TouchableOpacity>
  );
}
```

Try this example on Snack ⬈

See theming guide for more details and usage guide around how to configure themes.

Using with class component

You can wrap your class component in a function component to use the hook:

```
class MyButton extends React.Component {
  render() {
    // Get it from props
    const { theme } = this.props;
  }
}
```

```
// Wrap and export
export default function(props) {
  const theme = useTheme();

  return <MyButton {...props} theme={theme} />;
}
```
