Screen tracking for analytics

Unlike React Navigation, Expo Router always has access to a URL. This means screen tracking is as easy as the web.

1. Create a higher-order component that observes the currently selected URL

2. Track the URL in your analytics provider

📁 app

  🔲 _layout.js

🔲 app/_layout.js	📋 Copy

```js
import { useEffect } from 'react';
import { usePathname, useGlobalSearchParam

export default function Layout() {
  const pathname = usePathname();
  const params = useGlobalSearchParams();

  // Track the location in your analytics
  useEffect(() => {
    analytics.track({ pathname, params });
  }, [pathname, params]);

  // Export all the children routes in the
  return <Slot />;
}
```

Now when the user changes routes, the analytics provider will be notified.
