🏠   API reference   Actions   TabActions

Version: 6.x

TabActions reference

`TabActions` is an object containing methods for generating actions specific to tab-based navigators. Its methods expand upon the actions available in `CommonActions`.

The following actions are supported:

jumpTo

The `jumpTo` action can be used to jump to an existing route in the tab navigator.

- `name` - *string* - Name of the route to jump to.
- `params` - *object* - Screen params to pass to the destination route.

```
import { TabActions } from '@react-navigation/native';

const jumpToAction = TabActions.jumpTo('Profile', { user: 'Satya' });

navigation.dispatch(jumpToAction);
```
